

Stone Processing Plant (150-180TPH)

In comparison with 100-120TPH stone processing plant, 150TPH-180TPH stone processing line is more competent when processing medium or over hard ores, especially while it is used for producing big aggregate.

All the machines applied in this production line work together and form a circle flow production line, which improve the efficiency and make the central control easier.

The primary jaw crusher PE750X1060 equips with stronger, enhanced jaw plates and larger feed opening, which increases the reduction ratio. In addition, thicker steel plate has been applied to main frame and flywheels, while the diameter of the flywheels are enlarged that greatly increased the weight of the machine, so when it works, the vibration is very slight but the crushing kinetic energy is very forceful.

The secondary crusher we use is impact crusher which is widely used and welcomed by users in lots of countries due to its high working efficiency.

For the purpose of improving finished products' quality, water pipe or other washing equipments can be equipped upon filtrating equipments to clean the finished products.

Tertiary crusher such as VSI or others may work as additional processing machines to diversify the final products. Tailor-made dust catcher or dust cover can also be applied to this plant.

This production line calls for medium investment, you always get much more than you pay, it is the ideal choice for the clients.
